They are derived from the Powerpoint©slides from online resources provided by Pearson Addison-Wesley. The URL is: http://www.aw-bc.com/williamson

These lecture notes are meant as complement to the textbook and not a substitute. They are created for pedagogical purposes to provide a link to the textbook. These notes can be distributed with prior permission. This version compiled February 7, 2017.

Chapter 2: Measurement

- **1** Understand basic issues concerning measurement of key macroeconomic variables
- 2 Need understanding of variables to understand the important role they play in economic models
- 3 Measuring GDP
- 4 Nominal and real GDP and price indices
- 5 Savings, wealth and capital
- 6 Labor market measurement

Measurement: A Review

- Gross Domestic Product (GDP): dollar value of final output produced during a given period of time domestically.
- In the United States (US) measured quarterly as part of National Income and Product Accounts (NIPA).
- Three approaches:
- Product sum of all the value-added in the economy (do not count intermediate goods).
- 2 Expenditure total spending on all final goods and services in the economy (do not count intermediate goods).
- 3 Income add up all incomes received by economic agents contribution to production.

GDP	С		G	NX
\$18,000	\$12,300	\$3,000	\$3,312	-\$630

Components of GDP (2014)

The Circular Flow Model of Income and Output

National Income Accounting

Firm, Government and Household Sector

Table 2.1 Coconut Producer Total Revenue \$20 million Wages \$5 million Interest on Loan \$0.5 million Taxes \$1.5 million Table 2.3 After-Tax Profits Coconut Producer \$13 million Table 2.4 Government Tax Revenue \$5.5 million Wages \$5.5 million Profits Consumers States \$10 million Taxes \$13 million

GDP Using the Product Approach

Table 2.6 GDP Using the Product Approact	h
--	---

Value added - coconuts	\$20 million
Value added - restaurant food	\$18 million
Value added - government	\$5.5 million
GDP	\$43.5 million

GDP Using the Expenditure Approach

Table 2.7 GDP Using the Expenditure Approach			
Consumption \$38 million			
Investment		0	
Government Expenditures		\$5.5 million	
Net Exports		0	
GDP		\$43.5 million	

GDP Using the Income Approach

Table 2.8 GDP Using the Income Approach			
Wage Income \$14.5 million			
After-tax profits	\$24 million		
Interest Income	\$0.5 million		
Taxes	\$4.5 million		
GDP	\$43.5 million		

- Production of 13 million coconuts (instead of 10) and storing the additional 3 million
- Restaurant imports 2 million coconuts from other islands for \$2.00 each and all of the coconuts are used in the Restaurant

U.S. GDP: Key Components

Component of GDP	\$Billions	% of GDP
GDP	15,094.0	100.0
Consumption	10, 726.0	71.1
Durables	1, 162.9	7.7
Nondurables	2,483.7	16.4
Services	7,079.4	46.9
Investment	1,916.2	12.7
Fixed Investment	1,870.0	12.4
Nonresidential	1,532.5	10.2
Residential	337.5	2.2
Inventory Investment	46.3	0.3
Net Exports	-578.7	-3.8
Exports	2,085.5	13.8
Imports	2,664.2	17.7
Government Expenditures	3,030.6	20.1
Federal Defense	824.9	5.5
Federal Nondefense	407.9	2.7
State and Local	1,797.7	11.9

Problems with measuring GDP

TABLE 5.6 The World Underground Economy, 2002–2003

Region of the World	Underground Economy as Percent of Reported GDP
Africa	41%
Central and South America	41
Asia	30
Transition Economies	38
Europe, United States, and Japan	17
Unweighted Average over 145 Countries	35

Nominal vs. Real GDP

An Example of Nominal and Real GDP

Table 2.10 Data for Real GDP Example			
	Apples	Oranges	
Quantity in Year 1	$Q_1^a = 50$	$Q_1^0 = 100$	
Price in Year 1	$P_1^a = 1.00	$P_1^0 = \$0.80$	
Quantity in Year 2	$Q_2^a = 80$	$Q_2^0 = 120$	
Price in Year 2	$P_2^a = 1.25	$P_2^0 = 1.60	

- Period 1 nominal GDP is $GDP_1 = P_1^a Q_1^a + P_1^o Q_1^o = (1.x50) + (.8x100) = 130.$
- Period 2 nominal GDP is $GDP_2 = P_2^a Q_2^a + P_2^o Q_2^o = (1.25 \times 80) + (1.6 \times 120) = 292.$
- Percentage growth in nominal GDP from 1 to 2 is : $\frac{GDP_2 GDP_1}{GDP_1} \times 100 = 125 \text{ percent}$

An Example: Real GDP

- Setting period 1 real GDP as period 1 nominal GDP $RGDP_1 = GDP_1 = 130.$
- Holding prices constant in period 1 prices $RGDP_2 = P_1^a Q_2^a + P_1^o Q_2^o = (1.x80) + (.8x120) = 176.$
- Percentage growth in real GDP from 1 to 2 is : $\frac{RGDP_2 - GDP_1}{RGDP_1} \times 100 = \frac{176}{130} - 1 = 35.4 \text{ percent}$
- Holding prices constant in period 2 prices, real GDP in period 1 is $RGDP_1 = P_2^a Q_1^a + P_2^o Q_1^o = (1.25 \times 50) + (1.6 \times 100) = 222.5$

Chain-weighted Measure

- Chain-weighted ratio of real GDP between two periods is: $g_c = (g_1)^{.5}(g_2)^{.5}$ $g_c = (RGDP_2^1/RGDP_1^1)^{.5}(RGDP_2^2/RDGP_1^2)^{5.} = 1.333$
- This is a geometric average between consecutive ratios, each using either base year.
- So period 2 real GDP in period 1 dollars is $GDP_1 \times g_c = 130 \times 1.333 = 173.29$
- Or period 1 real GDP in period 2 dollars is $GDP_2 \div g_c = 292 \div 1.333 = 219.05$

Figure 1: Nominal and Chain-Weighted GDP

Price Level and CPI Inflation

Measures of Aggregate Price Level

General Price Level (P-GDP)

Implicit GDP price deflator =
$$\frac{\text{Nominal GDP}}{\text{Real GDP}} * 100$$

Consumer Price Index (CPI)

$$\mathrm{CPI} = \frac{\mathrm{Price}_{\mathrm{current}} * \mathrm{Quantity}_{\mathrm{base}}}{\mathrm{Price}_{\mathrm{base}} * \mathrm{Quantity}_{\mathrm{base}}} * 100$$

$$\mathrm{CPI}_{1} = 100 \text{ and } \mathrm{CPI}_{2} = \frac{222.5}{130} = 171.2$$

Measures of Aggregate Price Level (cont.)

Table 2.11 Implicit GDP Price Deflators, Example			le
	Year 1	Year 2	% Increase
Year $1 = base year$	100	165.9	65.9
Year $2 = base year$	58.4	100	71.2
Chain-weighting	100	168.5	68.5

Figure 2: Inflation using CPI and GDP deflator

Figure 3: Price Level, CPI vs. GDP deflator

Figure 4: The Relative Price of Housing in the United States

Accounting Identities

Private disposable Income (Y^d)

$$Y^d = Y + NFP + TR + INT - T$$

- NFP = Net Factor Payments,
- TR = Transfers from Govt to Private sector,
- INT=interest on govt debt,
- T = Taxes

Unemployment

Who is Unemployed?

- Jack having lost his job in a car factory
- 15 year old Mike going to High school
- Homemakers
- Undergrad student at TU looking for a summer job in June
- Person who is serving in the army
- Uncle Bob working 10 hours per month at the local library
- Ski instructor in June in Colorado

Definition of Unemployment

Labor Force:

- 16+,
- non-institutionalized
- non-retired
- non-student
- non-military and
- able to work
- Labor Force = Employed + Unemployed

Unemployment: Labor Force and Unemployment

The labor force participation rate is the fraction of the population that is over 16 years of age that is in the labor force

labor force participation rate = $\frac{\text{labor force}}{\text{population} > 16}$

- The labor force participation rate for this year was 62.8%
- Thee unemployment rate was 5.5%

Four Types of Unemployment

- **1** Frictional Unemployment
- 2 Seasonal Unemployment
- **3** Structural Unemployment
- 4 Cyclical Unemployment

- Jack having lost his job in a car factory
- 15 year old Mike going to High school
- Homemakers
- Undergrad student at TU looking for a summer job in June
- Person who is serving in the army
- Uncle Bob working 10 hours per month at the local library
- Ski instructor in June in Colorado

Unemployment Rates around the World

Alternative Measures of Unemployment
